

1. a) Simulate the **Selection Sort** algorithm to sort the following array in **descending** order, showing the state of the array after each iteration of the outer loop. [3]
[30 40 10 32]

```
max=A[0];
min=A[0];
for(i=1; i<n; i++){
    if (A[i]>max)
        max=A[i];
    else if (A[i]<min)
        min=A[i];
}
```

Data Set-I: 10, 20, 30, 40
Data Set-II: 40, 30, 20, 10
Data Set-III: 30, 10, 40, 20

3. a) Find the number of comparisons required to locate the position of the character 'U' in the given string using **Binary Search** algorithm. Show the results of each comparison step-by-step. [4]

Examples:

Note: You are NOT allowed to use loops or any extra parameters in the recursion.

4. a) Suppose a doubly linked list is headed by a pointer head and contains four nodes with data values 70, 80, 90, and 100, respectively. Each node contains three fields: ***prev** (pointer to the previous node), **value** (data value), and ***next** (pointer to the next node).
- i) Draw a diagram representing the doubly linked list. [1]
 - ii) Identify the pointer expressions for each node in the linked list with respect to the head. [2]
 - iii) Write an algorithm to insert a new node with the value 85 between the nodes containing the values 80 and 90. [2]
 - iv) Write an algorithm to delete the node containing the value 90. [2]
- b) Reverse the string "CSE" using a stack implemented with a linked list. For each push and pop operation, display the status of the stack. [2]
- c) For a queue of size m implemented using an array, explain how to check for overflow and underflow conditions. [2]
